

Abstract:

An apparatus for removing nails from a tape is provided. The apparatus comprises a guide that directs a path of movement of the tape through the apparatus. The guide has a transition end over which the tape passes as the tape moves
5 through the apparatus. The guide transition end is adapted to form a bend in the tape thereby exposing a head of the nail from the tape as the tape passes over the guide transition end. The apparatus further comprises a claw that is adapted to engage the nail head as the nail head is exposed when the tape passes over the guide transition end.
